

Easy Steps

WHAT IS

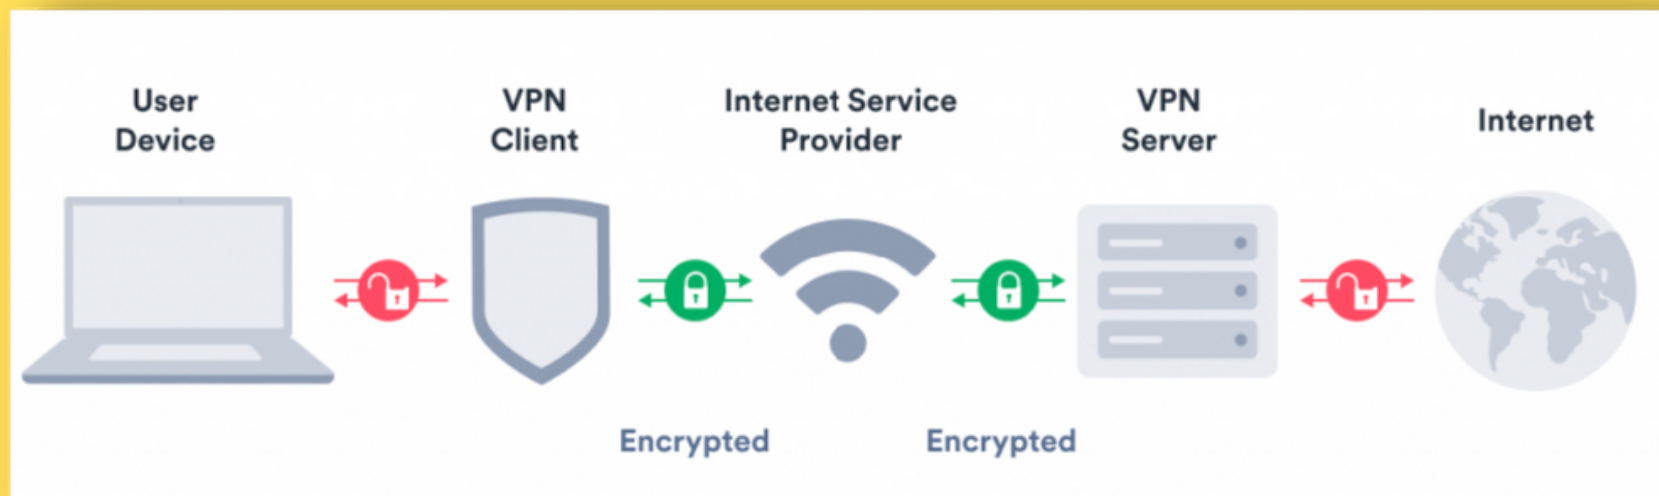

Bob was a tech-savvy individual who enjoyed tinkering with the latest gadgets

One day, while browsing through some tech forums, he came across an article about VPNs

Bob learned that **VPN** Stands for **Virtual Private Network**

A VPN creates a secure connection between two or more devices

by creating a tunnel over the public internet

The data is encrypted before it leaves one device and decrypted after it arrives at its destination

**This makes it almost impossible
for hackers to intercept any
information sent through
the network**

Since they can't read the data without knowing encryption keys used by both ends of the connection

Bob also found out that using a VPN could help him protect his personal information

when connecting to public Wi-Fi networks like those in coffee shops or airports

even if someone manages to gain access to these networks

they would still need encryption keys in order decrypt anything being sent from Bob's device
